Summary

Cybersecurity and cloud focused engineering student with hands-on experience deploying and monitoring AWS infrastructure, building full stack security platforms, and automating incident response. CCNA, CompTIA Security+, and Network+ certified with experience in EDR development and real time cloud pipeline design. Proven ability to deliver in fast paced technical environments through competitive cybersecurity and D1 athletics

Technical Skills

Languages: Python, Java, JavaScript, HTML/CSS, SQL, C, GO, React.js
Reverse engineering: Ghidra, x64dbg, IDA, hex editors (HxD), JADX, Apktool
Technologies: AWS, Wireshark, TShark, Docker, PuTTY, Nmap, Scikit-learn, Windows, Linux, Suricata

Education

Virginia Tech Expected May 2030
Bachelors of Science - Computer Engineering

- Incoming Freshman

Northern Virginia Community College 2024–2026
Dual Enrollment MATA Cybersecurity and CISCO

- Relevant Coursework:** Cybersecurity, Cisco Networking, Cloud Computing

Experience

ManTech Summer 2026
DFEND Intern (Incoming)

- Mobile Forensics and Reverse Engineering

Obscurity Labs Jun 2025 – Aug 2025
Software Engineer Intern

- Collaborated in a 5-week Agile internship developing an Endpoint Detection and Response (EDR) platform focused on detecting and responding to cybersecurity threats across Windows systems
- Developed a real-time Windows Event Log parser in Go using low-level Windows APIs to capture and normalize security events; implemented detection logic for suspicious authentication activity including Pass-the-Hash attacks
- Built backend and frontend components for a full alert management pipeline using Python/FastAPI, MongoDB, and React, including REST API endpoints, real-time alert dashboards, severity filtering, and automated threat response workflows

Certifications

<u>CompTIA Security+</u>	2026	<u>Cisco Certified Network Associate (CCNA)</u>	2025
<u>CompTIA A+</u>	2026	<u>CompTIA Network+</u>	2025
<u>CS50x: Introduction to Computer Science</u>	2024	<u>Certified Python Programmer (PCEP)</u>	2021

Projects

Network Intrusion Detection System | *Python, React, FastAPI, AWS, Docker*

- Developed a machine learning-powered intrusion detection system trained on 2.8M network flows to classify 14 attack types including DDoS, brute force, and SQL injection attacks
- Built a real-time detection pipeline using AWS VPC Flow Logs, FastAPI, and React to monitor network activity and visualize live attack predictions

Autonomous Security Operations Platform | *Python, Suricata, Wazuh, Raspberry Pi*

- Built a physical security operations platform using Suricata IDS, Wazuh SIEM, Raspberry Pi systems, and managed switches to detect and respond to live network attacks in real time
- Developed automated incident response workflows that correlated IDS alerts and dynamically pushed firewall rules across a multi-router topology to block malicious hosts within seconds
